

RECORDING MODES:

There are now three unique recording modes in SwingView Pro version 4.

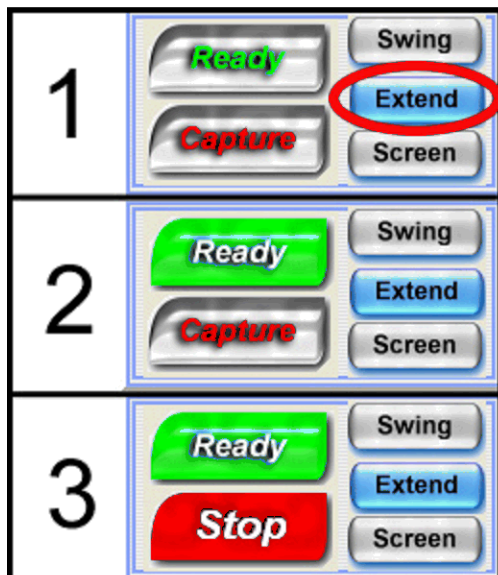

The first tab is called **Swing**, short for Swing Recording Mode.

1. Press the **Swing** tab if you want to capture individual swings.
2. Next, press the **Ready** button to get *ready* to capture a swing. **Ready** should turn bright green and you should see a live video preview.
3. Press the **Capture** button at impact to capture the swing. The **Capture** button will turn bright red and change to **Capturing** while the swing is trimmed, compressed and saved to your computer.

The swing you just recorded will appear in the swing list and is ready for playback. If you want to see “live” video again, just press the letter L on your computer keyboard. If you want to capture another swing, just click **Capture** again or press the

SPACEBAR on your keyboard. The **SPACEBAR** can be used in all recording modes to Start/Stop/Pause recording of video.

Note: All the recording modes have settings found under the Settings menu. You can vary the length of the capture and other parameters by pressing (ALT + V) to access the Swing Recording Mode Settings.

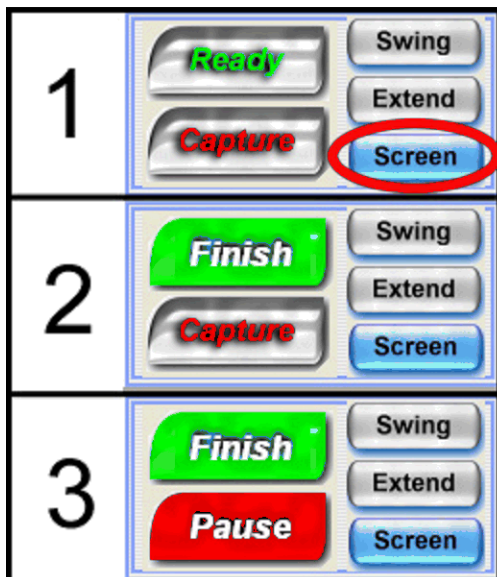

The second mode is **Extend**, short for Extended Record Mode.

1. Click the **Extend** tab if you want to capture longer video segments such as drills.
2. Next, press the **Ready** button to get *ready* to capture a drill or longer video segment. **Ready** will turn bright green and you should see a live video preview.
3. Click **Capture** to start recording video. The **Capture** button will change to a bright red **Stop** while video is being recorded. Press **Stop** to stop recording.

Again, the **SPACEBAR** can be used to start and stop recording in **Extend** mode. Recording full motion video with audio can be very demanding on your system. If you have problems capturing drills there are some options we've provided to help you out. Also, you may need to disable your anti-virus software to prevent

dropping frames while capturing drills.

Press (ALT + E) on your keyboard to access **Extend** settings. You need to have your camera attached to change any of the settings. The recommended defaults are: Check “Capture Audio” and “Crop Video 4:3”. Make sure your camera/video device is listed in the Video Device line and that the Video Size is set to “Full”. If you notice you are ‘dropping frames’ you should also check “Reduced Frame Rate”. If you need further assistance call Support: 561-848-8529.

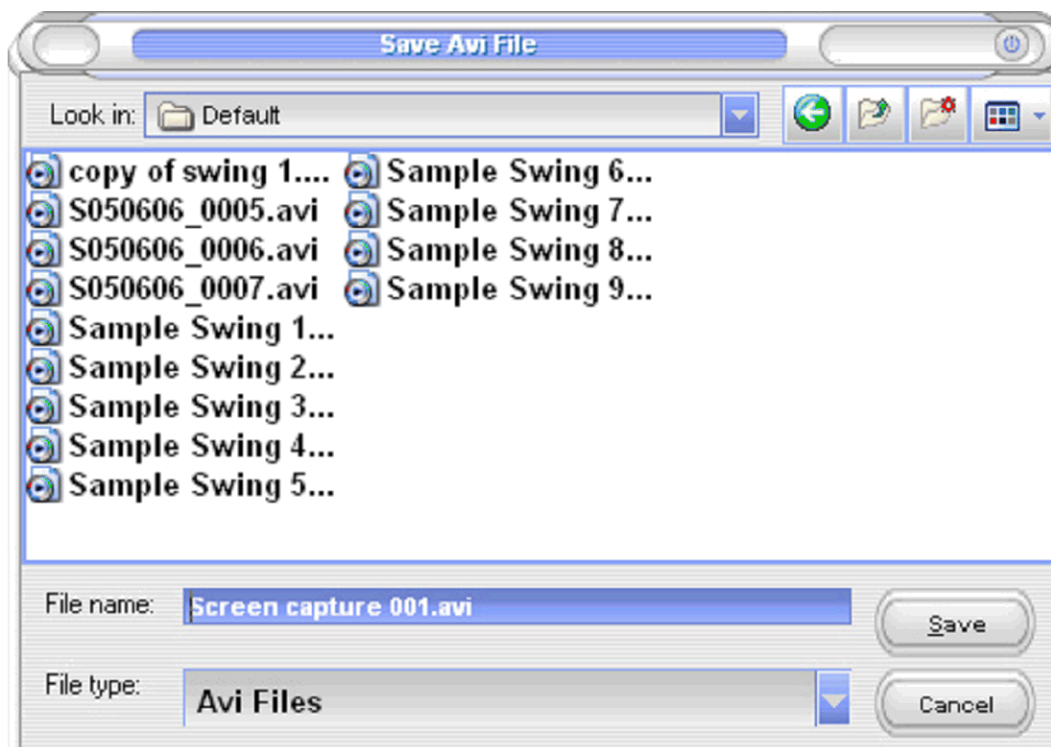

The third mode is called **Screen**, short for Screen Record Mode.

1. Press the **Screen** tab if you want to recapture a video of your 'live analysis'. Anything you draw on the screen or say into a microphone will be recorded as a new video.
2. To capture the screen to a new file, press the **Ready** button to set the system **Ready** to record the screen. The **Ready** button will turn bright green and change to the word **Finish**. Video is not yet recording.
3. Press the **Capture** button to begin recording the screen. The Capture button will change to the word **Pause** and turn bright red indicating the screen is being recorded. Advance the video and do some analysis. Pressing the **Pause** button will pause screen recording and you can resume and pause as many times as you like (by pressing **Pause / Capture**) until you are done with your analysis.

Once you are finished, click the **Finish** button (or the letter R on your keyboard) to end the recording. When you click **Finish** a small window will appear asking you to name the file you just captured.

In this mode, pressing the SPACEBAR is the same as pressing the **Pause / Capture** button. Try using it to pause & resume recording! It is very useful to pause video when you want to advance the swing to a new position or created detailed drawings before resuming the recording.

Your computer's video card has a great deal to do with the performance of this new capture mode. If you notice your video is very choppy, you may wish to press (ALT + R) and set the Recording Frame Rate to 2 instead of 5.
